HOW RATS HARMFUL TO US

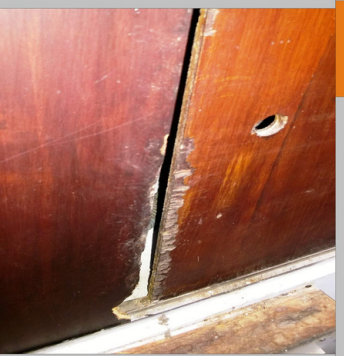

Rats and mice are not only a nuisance but can also cause property damage and transmit diseases. Rats are some of the most troublesome and damaging PEST in the India. They eat and contaminate food, damage structures and property, and transmit parasites and diseases to other animals and humans. Rats live and thrive in a wide variety of climates and conditions and are often found in and around homes and other buildings, on farms, and in gardens and open fields.

HOW RODENT MANAGE ?

If you identify rodents, there are several steps to take to ensure successful manage of these pests. Preventing and treating rodent infestations requires a combination of eliminating access points rats and mice might use to enter your home, removing food sources and shelter that attract rodents, and using traps to get rid of existing rats and mice in or around your home.

PESENCE OF BURROW & DROPPINGS

Check near junk piles, sheds, foundations, composts, etc. Roof Rats prefer to nest in locations off the ground and rarely dig burrows for living quarters if off-the-ground sites exist & inside buildings droppings with urination.

PRESENCE OF GREASY SPOT & FOOT MARK

Rat body hair release the greasy substance that stick to the vertical wall during their movement of route to identify their path next visit into dark night

PRESENCE OF GNAW MARK & SOUND AT NIGHT

Rat teeth tends to grow 1mm daily & to maintain their length they erase their teeth to the hard surface like around pipes, doorways, crawlspace vents, etc. Listen to GNAWING SOUNDS or the sound of rats running in attics, crawlspace and walls.

MANAGEMENT OF RATS

BUILDING MAINTENANCE

First step to take thorough inspect the entire building, then make priority on entry exit door which are having a gap under the doors & not closed properly due to the door closer not working properly. Rectify these by installing rubber gap filler on the bottom of each door & repair the door closer equipment. Reduce the source of water from outside garden area & surrounding premise.

PLAN THE TREATMENT

Educate the staff & manager of the buildings & intimate all how you are going to carried the treatment, what equipments you are going to use, what are the frequency of the treatment initially & later on ?
Because without co-operation of the ground staff & office staff rat management will not reach up to the mark.

Poisons & Traps are the best way to manage the rats after the preventive measures taken properly

PREVENTIVE MEASURES

ELIMINATION OF HARBOURAGE

Outside goods should be stacked on stands so there is 6-8” clearance below the pile and between the pile and any wall. Cut weeds and ornamental shrubs so that they do not hang into ditches or provide hidden runways along fence lines.

ELIMINATION OF FOOD

Garbage bags should not be used for waste food disposal; where their use is unavoidable, the bags should not be placed outside until garbage collection day; metal cans with tight fitting lids are the only truly rat-proof containers

PROOF THE BUILDINGS

Rats and mice are very mobile and canget into buildings inall sorts of ways. They can climb vertical surfaces and gnaw through walls and gaps around windows and doors. Mice need a hole only 12mm wide while rats can squeeze through holes not much bigger. They are also good swimmers using waterways and sewers.

CURATIVE MEASURES

SELECTION OF BAIT STATIONS

According to the types of the rodents presence & the types of the season running during the entire year, PMP's are going to select the types of the body using during their rodent control treatment.

Two types of Rat Bait Stations:
1) Metal Body &
2) Plastic PVC Body

PLACEMENT OF THESE BAIT STATIONS

Proper knowledge requires on moving the rats, having an experience in the field of rat/ rodent control methods. for the procedure comple grouting/ nailing work of these boxes to the wall inside / outside area to achieve the maximum control over these vertebrate invaders.

Paste the Caution/ Warning label on the upper lid & vertical wall surface of these boxes fitted, so that record shall be taken easily.

MANAGEMENT & SCOPE OF WORK

RECORD & DOCUMENTATION

REMOVAL OF DEAD RATS

SCOPE OF WORK

POISON BAIT TRAETMENT

Wax coated "Bromadiolone 0.005% RB" used outside premise strictly put inside the rodent bait station grouted to the floor level, use disposable gloves when handling baits & always wash your hands thoroghly afterwards

NON-POISON TRAP TREATMENT

Use sticky glue pads inside the stations fitted inside area of the facility & replace it on regular intervals, use disposable gloves when handling dead rats & always wash your hands thoroghly afterwards
Rats are smarter & tend to avoid traps,they learn quickly to stay away from traps. Placement of boxes must change on certain intervals

REMOVE DEAD RATS & RECORD

Prepare a SOP (Standard operating procedure) for the treatment for the entire year with a schematic drawing with proper layout mentioning all the equipments used during program.
